

PROJECT CONTROL IT INFRASTRUCTURE DEPLOYMENT SERVICES

molex[®]

IT INFRASTRUCTURE > DEPLOYMENT SPECIALISTS

Project Control

Project Control from Connected Enterprise Solutions (CES) is a full IT infrastructure deployment service for an organization's physical layer; that is, we manage a project starting with a plan for the structured cabling up through commissioning and handover, including attached IP devices.

The Project Control approach and service elements optimize deployments on even the most complex IT infrastructure projects - *multiple sites and multiple IP-enabled enterprise systems?* – not a problem! Project Control is particularly well-suited to organizations with locations remote from headquarters, especially multi-site IP system rollouts.

A single point of contact

Recognizing the 'time drain' on Project Owners caused by having to deal with multiple vendors and contractors during remote IT infrastructure deployments, we provide a single point of contact who is accountable for all aspects of vendor relations and logistics, covering all sites, no matter the location. As the key stakeholder, the Project Owner retains ultimate control of the overall project at all times.

24-7 project status availability

We address the specific needs of complex, remote, multi-site IT infrastructure builds and our unique methodology enables us to understand and manage every aspect of a project's physical layer and the attached IP devices.

It ensures 24-7 live project status updates for each deployment, meaning key stakeholders always have immediate access to decision-critical information, whenever they need it, wherever they are.

No more juggling resources

Project Control removes the burden on your IT and Facilities resources that would previously have been required to execute this type of highly-specialized project, leaving them free to focus on their core roles.

Total accountability

We're totally accountable, for each site we're asked to deliver, from planning through handover.

CONSULTING >

Your trusted advisor

As a technically-experienced leader in IP solutions design and manufacture, we're uniquely positioned to understand and help you solve your challenges. This experience means that we've become a trusted advisor for IT infrastructure deployments, globally.

We're vendor-neutral

From computer LAN, CCTV, access control, Wireless Access Points and asset tracking through to smart LED lighting solutions, building management systems and fire detection, 'Everything Over IP' has rapidly become the standard for both new build and retrofit projects.

You'd be forgiven for thinking we might insist on using our own products; however, our service is deliberately vendor-neutral, which means you'll always get the best of breed from a range of solutions, from the manufacturers you choose. If you prefer to use equipment from other manufacturers, that's fine by us.

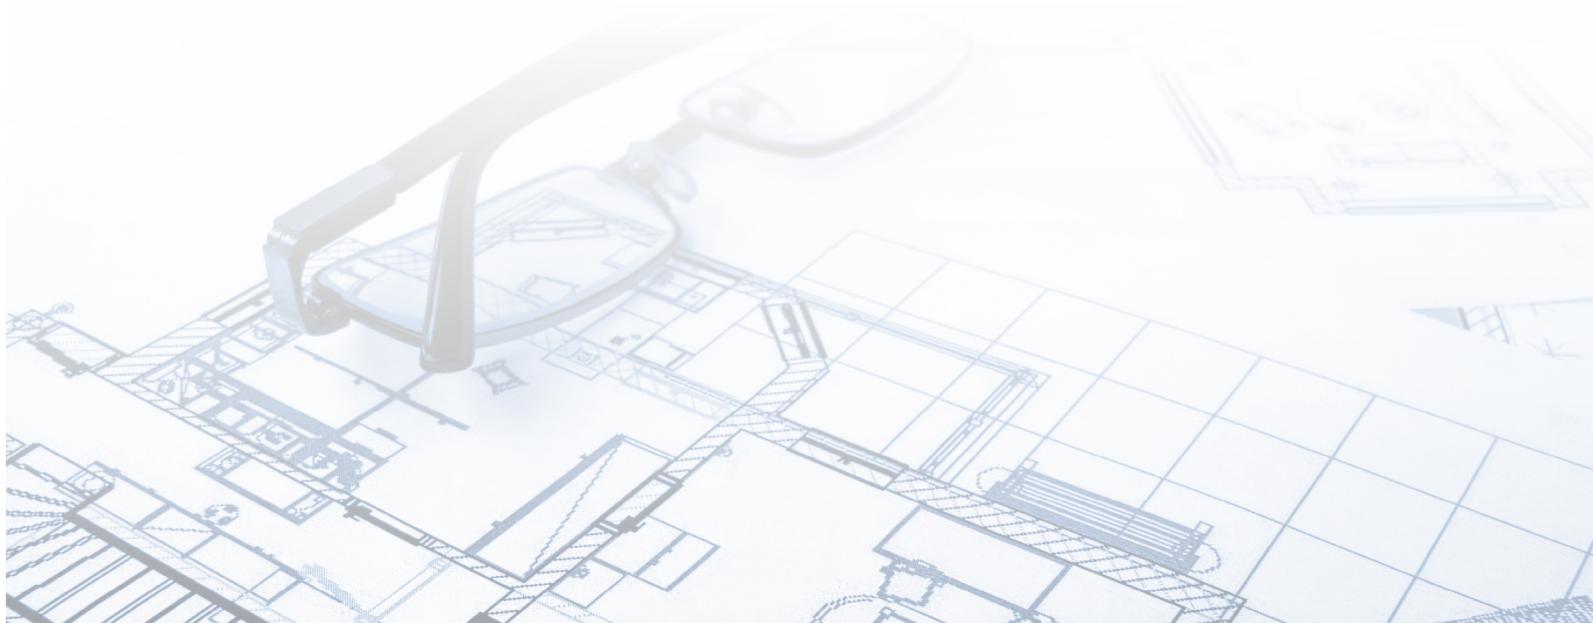

Our consultancy services include:

- Compliance management
- Relationship management
- Specification management
- Contractual obligation management

We're financially secure

Connected Enterprise Solutions is a business unit of Molex, LLC, which is wholly-owned by Koch Industries Inc, the second-largest privately-owned company in the United States (www.forbes.com) with 100,000+ employees in nearly 60 countries.

We come to the table debt-free, with absolute financial security and a highly stable operation.

DESIGN >

Collaborative by nature

Working collaboratively to get the design right first time is something that's intrinsic to the methodology and if you're looking to leverage the numerous benefits of an 'Internet of Things' (IoT) strategy, we're the right team to talk to.

By listening to key stakeholders and sharing ideas, it means we cover all the bases to ensure there aren't any nasty surprises halfway through an installation.

Excellence comes as standard

From helping you to understand what's possible in terms of the latest technologies and solutions, through system design and specifications, we provide a seamless, professional solution.

Our expertise includes:

- System design
- Product specification
- Project documentation
- Structured Cabling Systems
- IP-enabled devices
- Cost analysis
- Logistics

PROJECT PLANNING

We plan, to take the pain away...

Careful project planning is essential in any IT infrastructure project but particularly so for complex, remote multi-site deployments and simultaneous rollouts and that's essentially what Project Control does; it enables us to work with you to plan, predict and provision for every eventuality, providing 24-7 monitoring for key stakeholders.

We're totally accountable, from start to finish - we deal with vendors and by handling supplier agreements and logistics, we take away the pain typically associated with managing remote deployments.

'DON'T NEED TO DO' LIST

- Deal with multiple vendors and contractors 
- Manage logistics issues 
- Sort out currency issues 
- Track daily activities 
- Manage compliance issues 

PROJECT > DELIVERY

PROJECT CONTROL METHODOLOGY (PCM) PROVIDES:

- **Stakeholder control**
- **Project visibility**
- **Quality management**
- **Cost management**
- **Change management**
- **Key milestone monitoring**

Project delivery - art or science?

Successful delivery of complex, remote multi-site projects is in our DNA.

Some folk will tell you that managing projects is an art and it's probably true to say they've been trying to manage projects the same way since the pyramids were built.

While that might work for large, single-site projects, it's *not* such a great solution when it comes to the specific issues faced in remote multi-site deployments and global rollouts.

We believe that delivering complex, remote IP infrastructure projects should be less of an art and something altogether more scientific and predictable.

Project Control Methodology

We developed Project Control Methodology (or PCM for short) to address the specific needs of complex, multi-site IT infrastructure builds, where instant and consistent status clarity is a requirement.

It's simple to manage, accurate and highly effective, thanks to evidence-based monitoring.

ACCOUNTABILITY & COMPLIANCE

We're fully-accountable

When we're asked to manage IT infrastructure projects our approach is to take full responsibility, which means we start from the principle that we have to be fully-accountable to our customers, every step of the way.

Compliance is at the heart of every project

Legal and regulatory compliance is at the heart of Project Control and as a Koch Industries company, we believe there can be no shortcuts.

We provide risk mitigation, cost control and compliance services globally that include:

- Specification and Design to / via architects and consultants
- Product procurement
- Management and logistics (any manufacturer – not just Molex brands)
- Deployment / commissioning execution and management
- Management of local legal and insurance requirements
- Compliance to local regulations
- Consolidated billing – single vendor
- Real-time project status visibility and control for project stakeholders
